Responsibility for energy and environment

**RE Compatibility with EndoTherm**

May 2018

To whom it may concern:

The Manufacturers of Endotherm have presented information on the product which is inert with regard to the boiler material and does not interfere with the water treatment chemicals employed to prevent scaling/corrosion and we are comfortable with its introduction into the system.

Depending on the model our boilers are manufactured from either a ferrous material (ST, SRplus, CompactGas, Max-3 plus) a composite Stainless steel/ferrous tube and shell (Hoval UltraGas) or an Aluminium block (the wall mounted TopGas range). From the data provided from 3<sup>rd</sup> party laboratories, EndoTherm additive accounts for these materials in being non corrosive and will not affect the prevailing water treatment regime, were it to be used.

I can be contacted if further confirmation if required.
